

## Voyage Report: TAN2201 Chatham Rise trawl survey

---

**Date:** 28 February 2022

**Research Provider:** National Institute of Water and Atmospheric Research Limited

**Project Code:** MID2018/01

**Project Title:** Estimation of hoki and middle depth fish abundance using trawl surveys

**Principal Investigator:** Jennifer Devine

**Vessel:** R.V. *Tangaroa*

**Area:** Chatham Rise

**Voyage Start Date:** 4 January 2022

**Voyage End Date:** 3 February 2022

**Voyage Leader:** Darren Stevens

<b>Shift Leaders:</b>	0300 – 1500 Dan MacGibbon	1500 – 0300 Darren Stevens
<b>Voyage staff:</b>	Caroline Chin (Biosecurity) Pablo Escobar-Flores (IT & Acoustics) Craig Marsh Anjali Pande Derrick Parkinson Rikki Taylor Tim Currie (Blake Ambassador)	Brit Finucci (Chemical Officer) Jason Hamill (Health and Safety) Andrea Mari Brent Wood (IT & Acoustics) Jeremy Yeoman (Biosecurity) Georgia Third (Blake Ambassador)

## OVERALL OBJECTIVE

To continue the time series of relative abundance indices for hoki, hake, ling, and other middle depth and deepwater fish species caught on the Chatham Rise.

## SPECIFIC OBJECTIVES

1. To continue the time series of relative abundance indices of recruited hoki (eastern stock) and other middle depth and deepwater species on the Chatham Rise in January 2020 and 2022 using trawl surveys and to determine year class strengths of juvenile hoki (1, 2 and 3 year olds), with target CV of 20 % for the number of two year olds.
2. To collect data for determining the population age, size structure, and reproductive biology of hoki, hake, and ling on the Chatham Rise.
3. To collect data to underpin the development of assessment and monitoring capabilities for biodiversity and ecosystems.
4. To collect and preserve specimens of unidentified organisms taken during the trawl survey and identify them later ashore.
5. To sample deeper strata for deepwater species using a random trawl survey design.

## BACKGROUND

This survey was the 27th survey in the Chatham Rise time series using RV *Tangaroa*. Surveys were carried out annually from 1992–2014, and biennially since. The primary objective of the survey was to measure the abundance of both juvenile and adult hoki on the Chatham Rise. This is the most comprehensive time series of species abundance at water depths of 200 to 800 m in New Zealand's 200-mile Exclusive Economic Zone (O'Driscoll et al. 2011b).

Chatham Rise surveys provide relative biomass estimates of adult and juvenile hoki. Hoki is New Zealand's largest finfish fishery, with an annual catch limit of 110 000 t from 1 October 2021. Although managed as a single stock, hoki is assessed as two stocks in the New Zealand region, western and eastern. The hypothesis is that juveniles from both stocks mix on the Chatham Rise and recruit to their respective stocks as they approach sexual maturity. The Chatham Rise is also the principal residence area for the hoki that spawn in Cook Strait and off the east coast South Island in winter (eastern stock). Annual catches of hoki on the Chatham Rise peaked at over 75 000 t in 1997–98 and 1998–99. The catch from the Chatham Rise in 2019–20 was 32 900 t, making this the second largest hoki fishery in the EEZ (behind the west coast South Island), and contributing about 31% of the total New Zealand hoki catch (Fisheries New Zealand 2021).

To manage the fishery and minimise potential risks, it is important to have some predictive ability concerning recruitment into the fishery. Extensive sampling throughout the EEZ has shown that the Chatham Rise is the main nursery ground for juvenile hoki. Abundance estimation of two year old hoki provides the best index of potential recruitment to the adult fisheries, while the index of one year old hoki is also informative. The survey data from both juvenile and adult abundance are used directly in the stock assessment to estimate recruitment parameters, determine current stock size, and inform projections of future stock status. The continuation of the time series of trawl surveys on the Chatham Rise is a high priority to provide information required to update the assessment of hoki, hake, ling, and other middle depth species and to provide abundance information for a wide range of bycatch species.

Other commercial middle depth species (particularly hake and ling) and a wide range of non-commercial fish and invertebrates are also monitored by this survey. A review of the time series estimated biomass for 142 species or groups, with 49 of these species considered relatively well estimated (coefficient of variation (CV) less than 40%) (O'Driscoll et al. 2011b). For most of these species, the trawl survey is the only fisheries-independent estimate of abundance on the Chatham Rise. The survey time-series fulfils an important “ecosystem monitoring” role (e.g., Tuck et al. 2009), as well as providing inputs into single-species stock assessment.

In January 2010, the survey was extended to sample deeper strata (800 to 1300 m) to the north and east of the Chatham Rise. In January 2016, the survey duration was increased by 6 days to also include deeper strata to the south and west of the Chatham Rise. The 2022 survey again covered 800–1300 m depths around the whole Chatham Rise, providing fishery independent abundance indices for a range of common deepwater bycatch species in the orange roughy and oreo fisheries.

Acoustic data were recorded continuously (during trawls and while steaming between stations) on all trawl surveys on the Chatham Rise since 1995, except for 2004. Data from previous surveys were analysed to describe mark types, to provide estimates of the ratio of acoustic vulnerability to trawl catchability for hoki and other species, and to estimate abundance of mesopelagic fish (e.g., O'Driscoll et al. 2011a). Acoustic data also provide qualitative information on the amount of backscatter that is not available to the bottom trawl, i.e. either off the bottom, or over areas of foul ground. Other work carried out concurrently with the trawl survey included sampling and preservation of unidentified organisms caught in the trawl and collection of oceanographic (CTD) data.

## RESULTS

### *Trawl survey*

All survey objectives were completed. Weather conditions during the voyage were generally good although on occasions, the wind reached 30 to 40 knots (Figure 1). About 4 hours were lost due to a strong southerly front on the 27 January.

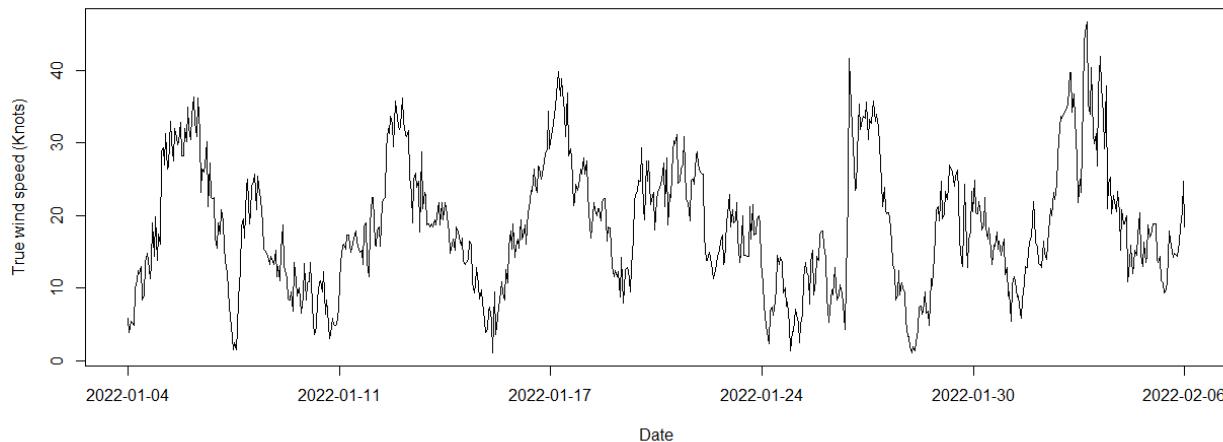

A total of 130 successful trawl survey tows were completed in 34 strata (Figure 2, Table 1). This included all 82 planned phase 1 tows, 6 phase 2 tows in core 200–800 m strata, and 42 of 43 planned deep tows. Due to logistical issues arising from a 18 t catch of black oreo, one station in stratum 27 was not able to be completed. Five further tows were considered unsuitable for estimating abundance and were substituted: tow 1 and tow 8 were rejected due to unsatisfactory gear performance; the generator stopped working while on tow 39 and the tow exceeded the maximum allowable distance (3.85 n.miles); tow 57 was outside of the stratum boundary; and tow 103 came fast.

The 6 phase 2 tows were carried out at the end of phase 1 to improve the CV for 1+ hoki (three tows in stratum 19) and 2+ hoki (three tows in stratum 20). Individual station details from all tows, including the catch of hoki, hake, and ling are listed in Appendix 1. The phase 2 tows reduced the CV for 1+ hoki in core strata from 38.9% to 33.7%, 2+ hoki in core strata from 20.4% to 17.3%, and total hoki in core strata from 11.1% to 10.1%.

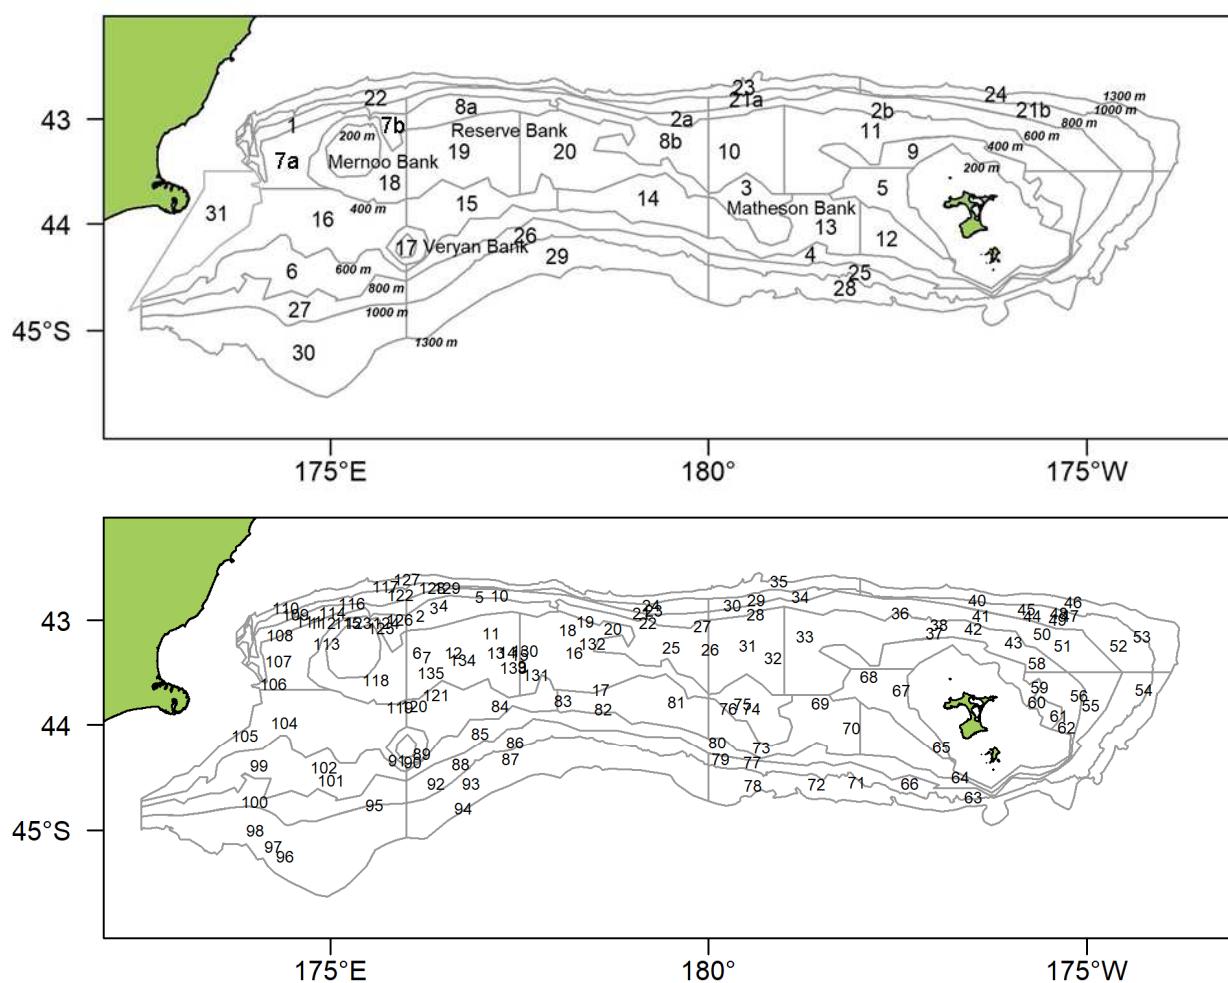

Preliminary biomass estimates and CVs for core (200–800 m) and all (200–1300 m) strata are given in Table 2. The CV for 2+ hoki (17.3%) was well below the MPI target of 20%. The CV's for total hoki (10.1%) and ling (10.7%) were below 15%, while the CV for hake (20.4%) was close to 20%.

The preliminary estimate of total hoki abundance in core strata was up (by 8.8%) from that of the most recent survey in 2020. The abundance estimate for 1+ (2020 year-class) was one of the lower estimates for the Chatham Rise time-series, while the estimate for 2+ (2019 year-class) hoki was above average for the time series. The abundance of older hoki (ages 3 and older) in core strata increased by 8.3% from 2020.

The preliminary abundance estimate for ling was down by 3.8% from the most recent survey in 2020. The estimate for hake increased by 59.2% from the 2020 survey (Table 2). Abundance estimates for most other species were higher than in 2020, in particular black oreo and silver warehou, which were mainly due to single large catches (18 t and 9.9 t respectively, Table 2).

**Figure 1:** Mean hourly wind speed during the voyage. Wind data from the *Tangaroa* automatic weather station and is corrected for vessel speed.

**Table 1: Stratum depth boundaries, areas, and numbers of planned and completed stations for the 2022 Chatham Rise survey. Trawl station locations are shown in Figure 2, with station details in Appendix 1.**

Stratum number	Depth range (m)	Location	Area (km <sup>2</sup> )	Phase 1 allocation	Completed stations

**Table 2:** Provisional abundance estimates (tonnes) with coefficient of variation (CV, in parentheses) of 25 common species for valid trawl tows in core (200–800 m) and all (200–1300 m) strata in 2022. Abundance estimates for all strata are compared to estimates from the previous survey in 2020 (from Stevens et al. 2021). Note: Sea perch are now separated into two species: *Helicolenus barathri* (HBA) and *H. percoides* (HPC).

Common name	Code	2022 core	2022 all	2020 core	2020 all

Orange roughy	ORH	5 (69.7)	1 967 (22.1)	13 (59.8)	3 087 (31.1)

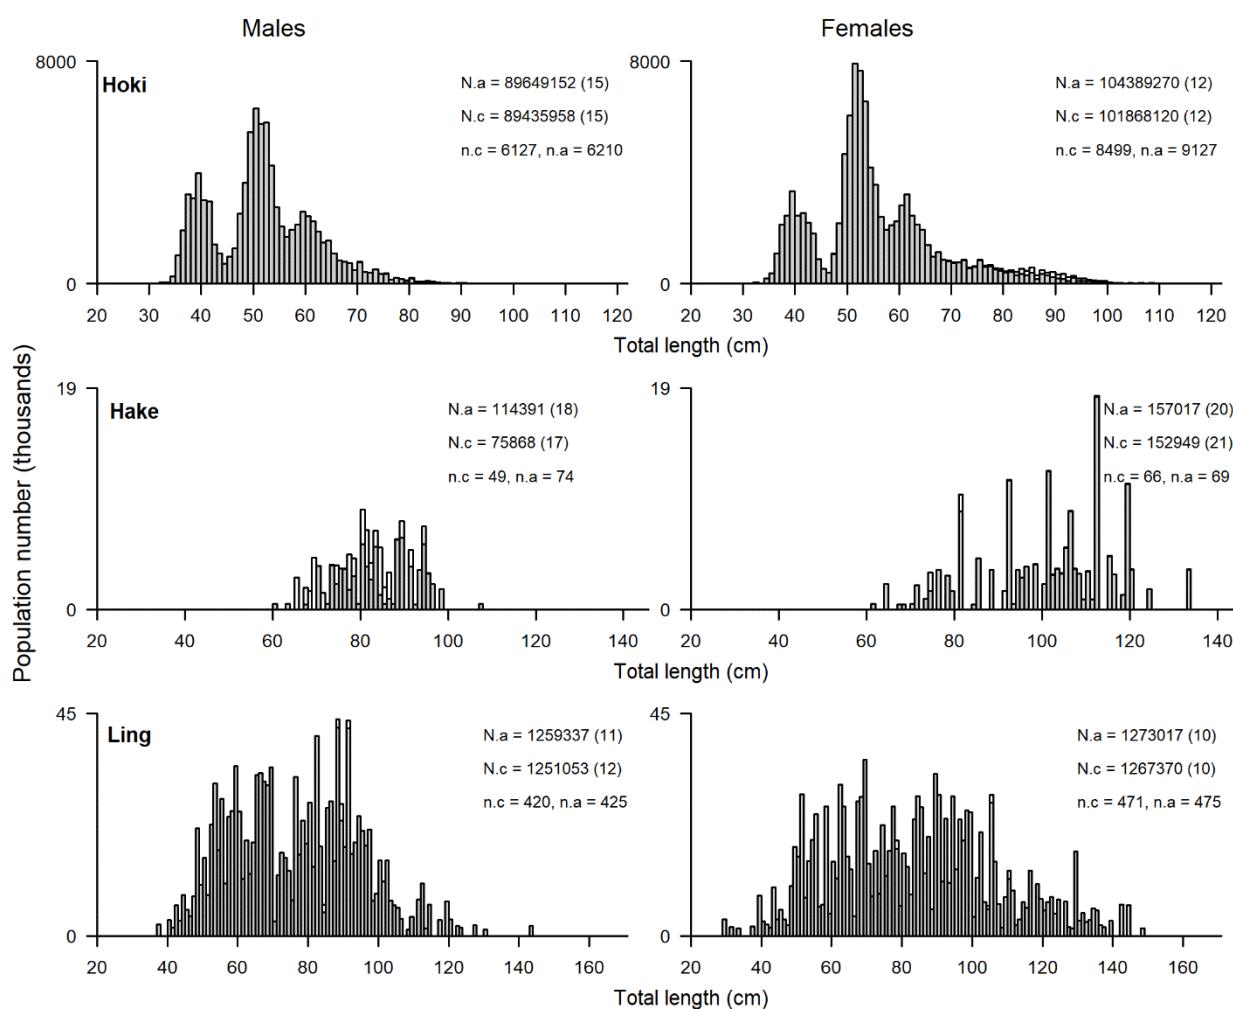

Trawl data were entered in real time using the electronic data capture system onboard the *Tangaroa* and were error-checked at sea. All species were weighed using motion-compensated scales on every successful trawl station. A total catch of 161.6 t was recorded from all trawl stations. From the 356 species or species groups caught during the trawl survey, 174 were teleosts, 29 elasmobranchs, 7 holocephalans, 19 squids or octopuses, 39 echinoderms, and 33 were crustaceans, the remainder comprised assorted benthic and pelagic animals. Of the total catch from all trawl survey tows, hoki accounted for 26.9%, black oreo 13.0%, silver warehou 12.9%, smooth oreo 5.4%, ling 1.8%, and hake 0.5% (Appendix 2).

#### Biological data

A random sample of all quota, commercially important, and selected non-commercial species were measured from all stations. A total of 78 976 fish, squid, and scampi of 133 different species were measured from all tows (Appendix 2). Of these, 26 359 fish were also individually weighed (Appendix 2). Additional data on fish condition (liver and gutted weight) were recorded from 1800 hoki. On this survey for the first time we also staged 380 arrow squid (*Nototodarus sloani*) using a new five-stage gonad maturity scale. Pairs of otoliths were removed from 1765 hoki, 722 ling, 146 hake, 423 orange roughy, 364 smooth oreo, 287 black oreo, 253 silver warehou, 176 ribaldo, 68 slender jack mackerel (*T. murphyi*), 21 greenback jack mackerel (*Trachurus declivis*), 33 barracouta, and 2 gemfish.

Population scaled length frequency data for hoki, hake, and ling are shown in Figure 3. The hoki scaled length frequency shows a mode at 33–45 cm representing the 1+ (2020) year class, a relatively strong mode at about 46–56 cm representing the 2+ (2019) year class, and a mode at about 57–65 cm representing the 3+ (2018) year-class. There was a broad distribution of female hake between 60 and 120 cm, while most male hake were 60–100 cm. The ling scaled length frequencies show a broad size distribution, with females, again, being slightly larger (Figure 3).

A total of 244 sample lots were inventoried and preserved. These included 55 lots of unusual or unidentified organisms retained for identification ashore (30 invertebrates to be identified under Ministry for Primary Industries contract BEN2021-03 and 25 fish specimens).

**Figure 3:** Provisional population scaled length frequency distributions for hoki, hake, and ling from the 2022 Chatham Rise trawl survey (all successful tows, including deep strata). N.a, estimated number of male fish (left panel) and female fish (right panel) from all (200–1300 m) strata; N.c, estimated number of male fish (left panel) and female fish (right panel) from core (200–800 m) strata; CV (in parentheses), coefficient of variation; n.c, number of fish measured from core strata; n.a, number of fish measured from all strata. White bars show fish from all strata. Black bars show fish from core strata.

#### Acoustic and related data

Over 2TB of acoustic data were collected with the multi-frequency (18, 38, 70, 120, and 200 kHz) hull-mounted EK60 systems on each trawl station and while steaming between stations. Weather and sea conditions during the survey were generally good, meaning acoustic data quality was high.

Sea temperature and conductivity (salinity) were measured using the Seabird CTD mounted on the trawl headline for all 135 bottom tows (including both valid and non-valid biomass tows). Surface temperatures ranged from 14.4° to 20.4° C (mean 16.8° C) and bottom temperatures ranged from 3.0° to 13.6° C (mean 7.7° C). Bathymetric data were collected by the Data Acquisition System (DAS) throughout the voyage.

## TIMETABLE

4 January	Loading and mobilisation of scientific equipment.
5 January	Tangaroa departed Wellington at 14:00 NZDT and proceeded to the survey area. Safety drills and training were carried out prior to departure.
6 January	Arrived in Chatham Rise survey area and began trawling in stratum 2A at 0656 NZDT.
6 Jan – 1 Feb	Trawl survey continues. 130 bottom trawls successfully completed including 82 core phase 1 tows, 6 core phase 2 tows, and 42 deep tows. About 4 hours lost due to a strong southerly front.
1 February	Trawl survey completed. Depart survey area at 1645 NZDT. Transit to Wellington and clean-up.
3 February	Arrive in Wellington at 08:00. De-mobilisation and unloading.

## PROCESSING OR DISPOSAL OF CATCH

All catch (see Appendix 2) was taken as specified in our Special Permit 665. We did our best to balance research survey requirements and processing and focussed our processing capacity on higher value fish (large hoki, hake, ling, and silver warehou) to get maximal return. The total weight of processed (head and gut, and some trunked ling and hake) fish landed was 16 253.7 kg, which was mainly silver warehou (5212 kg), hoki (3437 kg), smooth oreo (1850 kg), black oreo (1662 kg), and ling (1548 kg). All discarding was carried out (and reported as required) under the conditions of our Special Permit.

Sample collection followed the MPI biosecurity requirements for samples collected outside 12 n. miles. NIWA biosecurity permit number 2021078206 was used for the collection of non-viable (frozen) marine biological samples. All material were returned to MPI Biosecurity approved transitional facilities at NIWA.

## ACKNOWLEDGMENTS

Thanks to the officers and crew of the RV *Tangaroa* and to the scientific staff for making this a successful voyage. Thanks also to the Blake Ambassadors Georgia Third and Tim Currie for their enthusiasm and hard work. This report was reviewed by Jennifer Devine and made possible by Fisheries New Zealand funding under project MID2018-01.

## APPENDIX 2: BIOLOGICAL SAMPLE COLLECTION

Species	Scientific name	Common name	Catch weight (kg)	Number measured	Number weighed
AAM	<i>Apristurus ampeliceps</i>	Roundfin catshark	29.6	18	18
ABR	<i>Alepisaurus brevirostris</i>	Shortsnouted lancetfish	1.6	-	-
ACA	<i>Acanthephyra</i> spp.	Subantarctic ruby prawn	3.7	-	-
ACS	Actinostolidae	Smooth deepsea anemones	42.3	-	-
AEX	<i>Apristurus exsanguis</i>	New Zealand catshark	40.9	37	37
AFO	<i>Aristaeomorpha foliacea</i>	Royal red prawn	0.3	-	-
AGI	<i>Argyropelecus gigas</i>	Giant hatchetfish	0.8	-	-
AGK	<i>Apristurus garricki</i>	Garrick's catshark	0.8	3	3
AML	<i>Apristurus melanoasper</i>	Fleshynose catshark	5.3	4	4
ANI	<i>Austropenaeus nitidus</i>	<i>Austropenaeus nitidus</i>	0.1	-	-
ANT	Anthozoa	Anemones	1.9	-	-
ANZ	<i>Ecionemia novaezelandiae</i>	Knobbly sandpaper sponge	31.4	-	-
API	<i>Alertichthys blacki</i>	Alert pigfish	0.1	-	-
APN	<i>Apristurus pinguis</i>	Bulldog catshark	0.2	1	1
ARI	<i>Aristeus</i> spp.	<i>Aristeus</i> species	0.1	-	-
ARO	<i>Anthomastus (Bathyalcyon) robustus</i>	<i>Anthomastus (Bathyalcyon) robustus</i>	0.3	-	-
ASC	Ascidiae	Sea squirt	3.8	-	-
ASG	<i>Acesta saginata</i>	Lesser giant file shell	0.1	-	-
ASI	<i>Apristurus cf. sinensis</i>	Freckled catshark	10.2	7	7
ASR		Asteroid (starfish)	0.2	-	-
BAM	<i>Bathyplotes</i> spp.	<i>Bathyplotes</i> spp.	0.2	-	-
BAN	<i>Borostomias antarcticus</i>	Southern snaggletooth	0.5	-	-
BAR	<i>Thyrsites atun</i>	Barracouta	703.1	213	67
BBE	<i>Centriscops humerosus</i>	Banded bellowsfish	812.2	2 137	141
BCA	<i>Magnisudis prionosa</i>	Barracudina	4.3	4	4
BCR	<i>Brotulotaenia crassa</i>	Blue cusk eel	0.5	-	-
BEE	<i>Diastobranchus capensis</i>	Basketwork eel	786.7	827	437
BEN	<i>Benthodesmus</i> spp.	Scabbardfish	0.3	1	1
BER	<i>Typhlonarke</i> spp.	Numbfish	0.5	-	-
BES	<i>Benthopecten</i> spp.	Benthopecten spp.	0.1	-	-
BJA	<i>Mesovagus antipodum</i>	Black javelinfish	31.0	61	60
BMO	<i>Borostomias mononema</i>	<i>Borostomias mononema</i>	0.1	-	-
BNS	<i>Hyperoglyphe antarctica</i>	Bluenose	74.3	6	6
BOC	<i>Bolocera</i> spp.	Deepsea anemone	1.7	-	-
BOE	<i>Allocyttus niger</i>	Black oreo	20 968.7	1 631	300
BOO	<i>Keratoisis</i> spp.	Bamboo coral	0.3	-	-
BPA	<i>Bathylagichthys parini</i>	Parin's deepsea smelt	0.2	-	-
BPD	Brachiopoda	Lamp shells	0.4	-	-
BRG	Brisingida (Order)	Armless stars	9.0	-	-
BRL	<i>Brochiraja leviveneta</i>	Blue skate	0.2	-	-
BSH	<i>Dalatias licha</i>	Seal shark	145.6	57	57
BSL	<i>Xenodermichthys copei</i>	Black slickhead	285.2	798	201
BTA	<i>Brochiraja asperula</i>	Smooth deepsea skate	9.4	5	5
BTD	<i>Benthodytes</i> sp.	<i>Benthodytes</i> sp.	72.0	-	-
BTS	<i>Brochiraja spinifera</i>	Prickly deepsea skate	8.9	6	6
BYD	<i>Beryx decadactylus</i>	Longfinned beryx	2.2	1	1
BYS	<i>Beryx splendens</i>	Alfonsino	197.0	343	196
CAM	<i>Campylonotus rathbunae</i>	Sabre prawn	0.5	-	-
CAR	<i>Cephaloscyllium isabellum</i>	Carpet shark	7.6	3	3
CAS	<i>Coelorinchus aspercephalus</i>	Oblique banded rattail	356.3	1 824	557
CBA	<i>Coryphaenoides dossenus</i>	Humpback rattail (slender rattail)	29.6	13	13
CBE	<i>Notopogon lilliei</i>	Crested bellowsfish	1.9	11	-
CBI	<i>Coelorinchus biclinozonalis</i>	Two saddle rattail	348.5	515	219
CBO	<i>Coelorinchus bollonsi</i>	Bollon's rattail	3 274.4	3 578	1 137
CBS	<i>Poromitra atlantica</i>	Common bigscale fish	0.3	-	-
CCX	<i>Coelorinchus parvifasciatus</i>	Small banded rattail	6.3	102	57
CDO	<i>Capromimus abbreviatus</i>	Capro dory	8.5	95	-
CDX	<i>Coelorinchus maurofasciatus</i>	Dark banded rattail	1.8	10	10
CDY	<i>Cosmasterias dyscrita</i>	Cosmasterias dyscrita	0.3	-	-
CEX	<i>Coelorinchus celaenostomus</i>	Black lip rattail	0.9	-	-
CFA	<i>Coelorinchus fasciatus</i>	Banded rattail	84.1	798	337
CFU	<i>Corallistes fulvodesmus</i>	Smooth white cup sponge	1.9	-	-
CFX	<i>Coelorinchus supernasutus</i>	Supanose rattail	0.1	-	-
CHA	<i>Chauliodus sloani</i>	Viper fish	2.1	-	-
CHI	<i>Chimaera</i> spp.	<i>Chimaera</i> spp.	0.1	-	-
CHP	<i>Chimaera carophila</i>	<i>Chimaera</i> , brown	52.6	21	21

Species	Scientific name	Common name	Catch weight (kg)	Number measured	Number weighed
CHQ	Cranchiidae	Cranchiid squid	0.1	-	-
CHY	<i>Coelorinchus trachycarus</i>	Roughhead rattail	20.0	82	81
CIC	<i>Crella incrassata</i>	Orange frond sponge	1.4	-	-
CIN	<i>Coelorinchus innotabilis</i>	Notable rattail	49.5	651	377
CJA	<i>Crossaster multispinus</i>	Sun star	2.5	-	-
CKA	<i>Coelorinchus kaiyomaru</i>	Kaiyomaru rattail	8.6	96	89
CLL	<i>Corallium</i> spp.	Precious coral	0.1	-	-
CLM	Corallimorphidae	Coral-like anemones	1.1	-	-
CMA	<i>Coelorinchus matamua</i>	Mahia rattail	107.2	163	162
CMU	<i>Coryphaenoides murrayi</i>	Abyssal rattail	11.9	23	23
CMX	<i>Coryphaenoides mcmillani</i>	McMillan's rattail	1.2	-	-
COF	<i>Flabellum</i> spp.	Flabellum coral	1.3	-	-
COL	<i>Coelorinchus oliverianus</i>	Oliver's rattail	637.9	2 489	793
CON	Conger spp.	Conger eel	0.4	-	-
COT	<i>Cottunculus nudus</i>	Bony-skull toadfish	0.7	-	-
CPA	<i>Ceramaster patagonicus</i>	Pentagon star	0.1	-	-
CSE	<i>Coryphaenoides serrulatus</i>	Serrulate rattail	95.2	447	393
CSQ	<i>Centrophorus squamosus</i>	Leafscale gulper shark	495.7	69	69
CSU	<i>Coryphaenoides subserrulatus</i>	Four-rayed rattail	1 001.0	2 664	603
CTH	<i>Coelorinchus acanthiger</i>	Roughhead rattail	0.6	5	5
CTR	<i>Coryphaenoides striatus</i>	Abyssal rattail	0.4	2	2
CUB	<i>Cubiceps</i> spp.	Cubehead	2.3	7	7
CUC	<i>Paraulopus nigripinnis</i>	Cucumber fish	0.4	-	-
CVI	<i>Pycnoplax victoriensis</i>	Two-spined crab	0.3	-	-
CYO	<i>Centroscymnus owstoni</i>	Smooth skin dogfish	232.5	62	62
CYP	<i>Centroscymnus crepidater</i>	Longnose velvet dogfish	1 218.0	881	537
DAP	<i>Dagnaudus petterdi</i>	Antlered crab	1.9	-	-
DCO	<i>Notophycis marginata</i>	Dwarf cod	0.3	-	-
DCS	<i>Bythaelurus dawsoni</i>	Dawson's catshark	0.3	1	1
DDA	<i>Diaphus danae</i>	Dana lanternfish	0.7	-	-
DEA	<i>Trachipterus trachypterus</i>	Dealfish	1.7	-	-
DHO	<i>Dermechinus horridus</i>	Sea urchin	34.1	-	-
DIP	<i>Diplophos</i> spp.	Twin light dragonfishes	0.1	-	-
DIR	<i>Diacanthurus rubricatus</i>	Pagurid	1.1	-	-
DIS	<i>Diretmus argenteus</i>	Discfish	0.2	-	-
DMG	<i>Dipsacaster magnificus</i>	<i>Dipsacaster magnificus</i>	21.8	-	-
DPP	<i>Diplopteraster</i> sp.	<i>Diplopteraster</i> sp.	0.4	-	-
DSK	<i>Amblyraja hyperborea</i>	Deepwater spiny skate (Arctic skate)	21.4	1	1
DSS	<i>Bathylagus</i> spp.	Deepsea smelt	0.1	-	-
ECN		Echinoid (sea urchin)	0.1	-	-
ECR	<i>Echiodon cryomargarites</i>	Messmate fish	1.0	38	-
ECT	Echinothuriidae	Echinothuriidae (family)	1.6	-	-
EEX	<i>Enypniastes eximia</i>	<i>Enypniastes eximia</i>	4.2	-	-
EGC		Egg case	0.1	-	-
EPD	<i>Epigonus denticulatus</i>	White cardinalfish	0.6	-	-
EPL	<i>Epigonus lenimen</i>	Bigeye cardinalfish	22.4	139	40
EPM	<i>Epigonus machaera</i>	Thin tongue cardinalfish	39.5	341	157
EPO	<i>Melanostigma gelatinosum</i>	Limp eel pout	0.6	-	-
EPT	<i>Epigonus telescopus</i>	Deepsea cardinalfish	150.1	369	205
EPZ	<i>Epizoanthus</i> spp.	<i>Epizoanthus</i> spp.	1.2	-	-
ERA	<i>Torpedo fairchildi</i>	Electric ray	7.1	2	2
ERB	<i>Epigonus robustus</i>	Robust cardinalfish	1.3	-	-
ERE	<i>Euplectella regalis</i>	Basket-weave horn sponge	0.4	-	-
ETB	<i>Etmoster baxteri</i>	Baxter's lantern dogfish	964.2	702	439
ETL	<i>Etmoster lucifer</i>	Lucifer dogfish	61.3	365	324
EZE	<i>Enteroctopus zealandicus</i>	Yellow octopus	16.3	-	-
FAN	<i>Pterycombus petersii</i>	Fanfish	1.8	-	-
