

# Why play a game?

To deliver information in a way that activates

Climate change adaptation is a complex problem

**Often that complexity can be bewildering:**

- People simply don't grasp the implications of the trade-offs and choices available or
- They have difficulty knowing how to combine information in a way that supports decision making.

**Game play allows the player to:**

- Visualise options & multiple futures
- Experiment within a 'safe' environment
- Demonstrates a framework
- Learning from & with others
- Reveals values
- Builds relationships
- Games 'prime' further conversations

**Players gain:**

- the confidence to start the planning and strategy process
- a framework to process complexity within their own context
- an understanding of science-based options and their limits
- an understanding of their values and the values of those around them

Doing things differently to live well in a changing world
